Muscle contraction happens at the level of the sarcomere. The sarcomere is comprised of two protein filaments — the thick filament is made of the protein myosin and the thin filament made of the protein actin. (Incidentally, that's why protein consumption is important in muscle development. Protein is the fundamental building block in muscle.)

Physiology of Muscles | Baseline of Health

Human muscle system, the muscles of the human body that work the skeletal system, that are under voluntary control, and that are concerned with movement, posture, and balance. Broadly considered, human muscle—like the muscles of all vertebrates—is often divided into striated muscle, smooth muscle, and cardiac muscle.

human muscle system | Functions, Diagram, & Facts | Britannica

In fact, skeletal muscle is the most adaptable tissue in the human body and muscle hypertrophy (increase in size) is a vastly researched topic, yet still considered a fertile area of research. This column will provide a brief update on some of the intriguing cellular changes that occur leading to muscle growth, referred to as the satellite cell theory of hypertrophy.

How Do Muscles Grow?

But exciting hands-on activities—like building this set of faux muscles and bones—are an effective way to transform the study of anatomy into something students can actually see and touch. In addition to the wide array of science and health books included in Science F: Health, Medicine and Human Anatomy , there are also a plethora of hands-on activities, scheduled at regular intervals ...
